ABSTRACT

The tables in this report show birthplace and residence in 1956 for the Negro population in the six standard metropolitan statistical areas (SMSA's) which contained a central city with 500,000 or more Negro population at the time of the 1970 census. The tables show that Southern-born blacks living in the six metropolitan areas generally are slightly more likely to be married and living with their spouse than Nothern-born blacks. The relatively high proportions married and living with their spouse among the Southern-born were due primarily to a low proportion single (never married); of black males 18 and over who were born in Illinois and living in the Chicago SMSA in 1965 and 1970, 31.9 percent reported never having been married, compared to 11.1 percent among the Southern-born black males 18 and over living in the Chicago SMSA in 1965 and 1970. In addition to higher rates of marriage, the tables reveal higher rates of marital fertility among Southern-born black women in the six SMSA's. An important fertility difference exists between the early migrants from the South (those who moved before 1965) and the recent migrants from the South (those who moved since 1965). Among black women under 35 years of age, the recent migrants have lower fertility than the early migrants, but among women over 35 the recent migrants generally have higher fertility than the early migrants. One may also note that in the six SMSA's the Southern-born black males generally have slightly higher labor force participation rates than the Northern born. Data in this report are from a 15 percent sample and are, therefore, subject to sampling variability. (Author/JM)

SUPPLEMENTARY REPORT

Characteristics of Negro Immigrants to Selected Metropolitan Areas: 1970

The tables in this report show birthplace and residence in 1965 for the Negro population in the six standard metropolitan statistical areas (SMSA's) which contained a central city with 500,000 or more Negro population at the time of the 1970 census.

The tables show that Southern-born blacks living in the six metropolitan areas generally are slightly more likely to be married and living with their spouse than Northern-born blacks. For example, among black males 18 and over living in the Chicago SMSA in 1965 and 1970, 51.2 percent of those born in Illinois (column 2 of table 1) were in the category "married, spouse present," compared to 69.6 percent of those born in the South (column 6). The relatively high proportions married and living with their spouse among the Southern-born were due primarily to a low proportion single (never married); of black males 18 and over who were born in Illinois and living in the Chicago SMSA in 1965 and 1970, 31.9 percent reported never having been married, compared to 11.1 percent among the Southern-born black males 18 and over living in the Chicago SMSA in 1965 and 1970.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce District Offices. Price 45 cents domestic postpaid or 30 cents G.P.O. Bookstore.

UD 014120

In addition to higher rates of marriage, the tables reveal higher rates of marital fertility among Southern-born black women in the six SMSA's. For example, ever married black women 15-24 years old who were born in Michigan and living in the Detroit SMSA in 1965 and 1970 reported 1,308 children ever born per 1,000 women, compared to 1,612 children ever born per 1,000 women ever married for the Southern-born black women 15-24 living in the Detroit SMSA in 1965 and 1970. A similar pattern prevails at later ages for the Detroit SMSA and for the other SMSA's.

An important fertility difference exists between the early migrants from the South (those who moved before 1965) and the recent migrants from the South (those who moved since 1965). Among black women under 35 years of age, the recent migrants have *lower* fertility than the early migrants, but among women over 35 the recent migrants generally have *higher* fertility than the early migrants. In the Detroit SMSA, for example, Southern-born black women 15-24 who were living in the Detroit SMSA in 1965 (the early migrants) reported 1,612 children ever born per 1,000 women ever married, compared to 1,401 children ever born per 1,000 women ever married among the 15-24-year-old black women living in the South in 1965 (the recent migrants). A similar pattern exists for women 25-34 years old. But black women over 35 who recently moved from the South spent most of their childbearing years in the traditionally high-fertility South and reported more children ever born than black women who had spent most of their childbearing years in metropolitan areas outside the South. In Detroit, black women 35-44 who were born in the South but living in the Detroit SMSA in 1965 reported 3,679 children ever born per 1,000 women ever married; among more recent black migrants from the South, there were 4,794 children ever born per 1,000 ever married women 35-44 years old. At this age, therefore, the fertility difference between early and recent black migrants amounts to more than one child per ever married woman.

One may also note that in the six SMSA's the Southern-born black males generally have slightly higher labor force participation rates than the Northern-born. In the New York City SMSA, for example, among black men 16 years old and over those born in New York State and living in the New York City SMSA in 1965 reported labor force participation rates of 65.2 percent, compared to 78.4 percent among the early migrants from the South, and 81.5 percent for the recent migrants from the South.

DEFINITIONS

The statistics presented here are drawn from the tabulations made for 1970 census Final Report PC(2)-2C, which contains more detailed definitions and technical explanations. This type of information also appears in the Series PC(1)-C and PC(1)-D final reports.

SAMPLE SIZE

Data in this report are from a 15-percent sample and are, therefore, subject to sampling variability. A description of the sample design and information on sampling variability appear in the PC(2)-C, **Mobility for Metropolitan Areas.**

SYMBOLS

A dash "-" signifies zero. Three dots "..." mean that the base for the derived figure is too small for it to be shown.
